

EYNIS

The Intelligence Layer for Physical Businesses

Hotels run on systems. None of them think.
We built the layer that does.

THE PROBLEM

A hotel runs 4 to 6 systems. They don't talk to each other.

What each system knows

→ PMS

Knows who checked in

→ POS

Knows what they ordered

→ CRM

Knows they stayed before

→ Staff

Knows none of this

What this costs you

It's 3 PM on a Tuesday. The restaurant has 12 empty tables. 28 guests are in their rooms. Nobody tells the guests. Nobody connects the two. That revenue window closes in 3 hours and nobody noticed.

or

Guest calls front desk for extra towels. Front desk tells housekeeping on WhatsApp. Message gets missed in a group chat. Guest calls again 20 minutes later. This happens 15 times a day at a mid-size hotel.

This happens hundreds of times a day across every property.

📄 **The data exists. The action doesn't.**

THE PRODUCT

Eynis connects to every system a hotel already uses and makes them work as one.

Nothing gets replaced. Everything gets smarter.

Data Layer

Pulls from PMS, POS, CRM, WhatsApp. One unified model.

Intelligence Layer

Understands guest context. Finds revenue opportunities.

Automation Layer

Triggers workflows. Routes requests. No human needed.

Interface Layer

Dashboard for management. Real-time view of everything.

API Layer

Connects to any system. Built to scale.

HOW IT WORKS

One guest. One stay. Here's where Eynis fires.

This is what one normal day looks like with Eynis running.

Real scenarios. Real revenue.

1

Upsell at the right moment

Guest books standard room. Eynis detects next day is her birthday. 6 hours before arrival, sends an upgrade offer. Conversion: **40%**. Revenue per upgrade: **Rs. 1,500 to Rs. 3,000**.

2

Last-minute occupancy fill

Tuesday. Occupancy at 55%. Eynis detects 12 empty rooms by 5 PM. Triggers a flash deal to past guests within 200km via WhatsApp. **3 bookings** come in by 8 PM.

3

Service request routing

Guest asks for extra towels. Eynis logs it, routes to housekeeping, timestamps it, and follows up in 8 minutes if unresolved. No call to front desk. No message chain.

4

F&B upsell during slow hours

Restaurant empty at 3 PM. Eynis sends "Afternoon tea, 30% off" to all in-house guests. Response rate: **18 to 25%**. Four tables fill up.

5

Repeat guest recognition

Guest walks in. Eynis has already briefed front desk: last visit had a noise complaint, prefers high floors, ordered room service twice. Staff greets them with a solution before they even bring it up.

HARDWARE

The software works on its own. The device takes it to the room.

For hotels that want full in-room integration, Eynis ships a Smart Concierge Device. It sits in the room and connects directly to the Eynis system.

What guests do with it

- Request housekeeping, towels, room service without picking up the phone
- Ask for recommendations, check-out info, local services
- Control room preferences by voice or touch

Pricing

One-time device cost plus an optional hardware service subscription.

What happens in the backend

Every request is logged, routed to the right staff, timestamped, and tracked to resolution. Nothing falls through.

Why it matters for the hotel

- Front desk call volume drops significantly
- Every request becomes a data point Eynis learns from
- Upsell triggers fire at the right moment: guest asks for room service, Eynis suggests an add-on before the order is placed

Hotels can start with software only and layer in hardware when ready.

Most hotels lose significant staff productivity to not knowing what to do.

New staff spend weeks learning SOPs. Experienced staff forget protocols under pressure. Quality becomes inconsistent. Eynis trains a system on the hotel's own SOPs, past service records, and operational data.

Staff asks Eynis

"Guest is upset about a billing error, what do I do?"

Step-by-step resolution flow, escalation path, and compensation policy. In plain language. Instantly.

"What's the room service cutoff for the restaurant tonight?"

Eynis answers in 3 seconds. No calling the kitchen. No guessing.

What this changes

- New staff are productive in days, not weeks
- Quality of service stops depending on who's on shift
- Management gets fewer escalations

Every tool a hotel uses today solves one piece. Nobody connects them.

Product	What it does	What it misses
IDS Next / Hotelogix	PMS, stores bookings	No intelligence, no automation
RateGain / Staah	Rate management	Narrow scope, not unified
Revinate	Guest CRM	Post-stay, not real-time
Aiosell	Revenue management	No guest layer, no staff layer
Eynis	Sits above all of them	Makes each one more valuable the day it connects

 No product today unifies operations, guest intelligence, and revenue automation for physical businesses in India at this level.

REVENUE IMPACT

The numbers a 50-room hotel should expect.

Rs. 1,100+ Rs. 24.5K Rs. 7L 15x

Extra spend per guest	Daily revenue uplift	Monthly uplift	Maximum ROI
Up from Rs. 800/day baseline	At the high end, per property	Rs. 3L to Rs. 7L range	5x minimum. 15x maximum.
Metric	Current	With Eynis	
Occupancy	70% (~35 guests/day)	Same	
Extra spend per guest	Rs. 800/day	Rs. 1,100 to Rs. 1,500/day	
Daily revenue uplift	0	Rs. 10,500 to Rs. 24,500	
Monthly uplift	0	Rs. 3L to Rs. 7L	
Annual uplift	0	Rs. 36L to Rs. 84L	
Eynis cost		Rs. 30,000 to Rs. 1,00,000/month	

Breakdown driven by F&B upsell, late checkout, upgrades, and service conversion.

THE ASK

We are raising to prove this with real hotels and real data.

What the money does

01

Product and engineering

Complete the core intelligence and automation layer

02

Pilot deployment

Onboard and support the first 3 to 5 hotels

03

Revenue validation

90 days of real transaction data, case studies with hard numbers

04

Sales

Convert pilots to paid, close the first 20 hotels

What Year 1 looks like

Phase	Timeline	Goal
Pilots	Months 1 to 3	3 to 5 hotels live, tracking every rupee
Validate	Months 4 to 6	Hard revenue numbers, repeatable onboarding
Scale	Months 7 to 12	10 to 20 paying hotels, first chain conversation

We are not building before we have proof. We are proving it first, then scaling.

Every hotel in India is running blind right now. We are building the thing that fixes that.
